Introduction

CGC is generally easy and obtained by retrograde cannulation

- Snare (BAILOUT)

Retrograde CGC is a step requiring "wire skills"

In some circumstances, CGC can be difficult

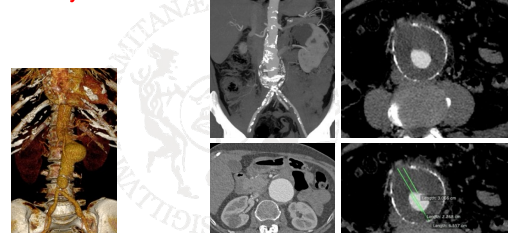

- Increased fluoroscopy time
- Longer procedural time
- More endovascular materials for bailout
- Higher risk of complications
- Higher costs

Università degli Studi di Palermo
MFC
M.Pa.C.C. Department of Precision Medicine in Medical, Surgical and Critical Care

Anatomic variables negatively influence the CGC time

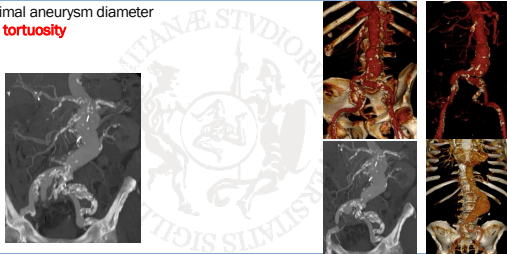

- Maximal aneurysm diameter

Università degli Studi di Palermo

Anatomic variables negatively influence the CGC time

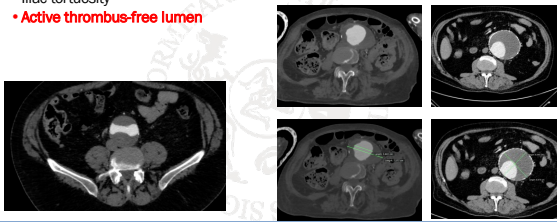

- Maximal aneurysm diameter
- Iliac tortuosity
- Active thrombus-free lumen

Università degli Studi di Palermo
MFC
M.Pa.C.C. Department of Precision Medicine in Medical, Surgical and Critical Care

Anatomic variables negatively influence the CGC time

- Maximal aneurysm diameter
- Iliac tortuosity
- Active thrombus-free lumen
- Aortic bifurcation angulation**

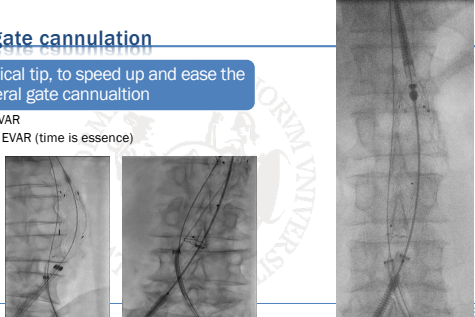

Università degli Studi di Palermo | Dipartimento di Medicina, Chirurgia e Odontologia

Speed gate cannulation

Is a technical tip, to speed up and ease the contralateral gate cannulation

- Elective EVAR
- Emergent EVAR (time is essence)

Università degli Studi di Palermo | Dipartimento di Medicina, Chirurgia e Odontologia

Retrospective Analysis - SGC

Improved technique for sheath supported contralateral limb gate cannulation in endovascular abdominal aortic aneurysm repair

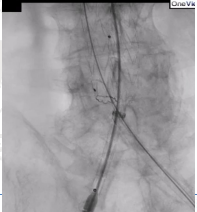

55 patients

Technical success 100 %.

CLG cannulation fluoro time 37.6 ± 33 (range 1–105) seconds.

SG Deployed in crossed limb "ballerina" configuration - 48 (87,3%)

No correlation with aneurysm Maximal TD, active aortic lumen, aortic carrefour diameter, stent-graft introduction side or deployment configuration.

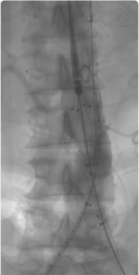

Università degli Studi di Palermo | Dipartimento di Medicina, Chirurgia e Odontologia

Carrefour angulation on Coronal Axis

- The aortic carrefour angulation on coronal axis strongly correlates with cannulation time $p = <.001$.
- Higher was the carrefour angulation on coronal axis, higher was the cannulation time (Pearson correlation coefficient 0.47).

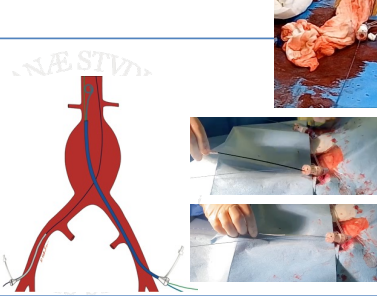

Università degli Studi di Palermo | Dipartimento di Medicina, Chirurgia e Odontologia

SGC - Technique

Buddy wire - Left Axis

- From the main body contralateral access
- A 30 cm 12 to 18 Fr introducer sheath is inserted over a stiff wire and advanced into the aorta below the proximal neck.
- Coaxially insertion of an additional 0.035-inch standard J-tip guidewire with a 5 Fr Pigtail angiographic catheter through an inflatable valve.

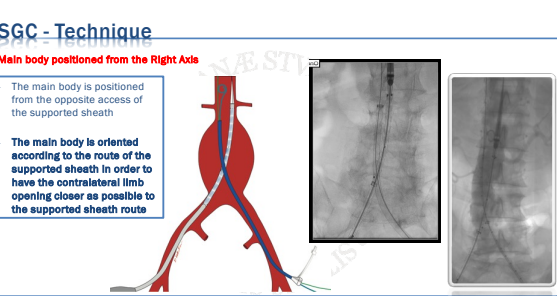

Università degli Studi di Palermo | Dipartimento di Medicina, Chirurgia e Odontologia

SGC - Technique

Main body positioned from the Right Axis

- The main body is positioned from the opposite access of the supported sheath
- The main body is oriented according to the route of the supported sheath in order to have the contralateral limb opening closer as possible to the supported sheath route

Università degli Studi di Palermo | Dipartimento di Medicina, Chirurgia e Odontologia

SGC - Technique

Retrieve the Sheath at CLG opening

- The supported sheath is retrieved until the level of the contralateral limb
- The main body is deployed
- The coaxial wire with catheter are retrieved and employed to catheterize the contralateral limb

Università degli Studi di Palermo | Mr. Prof. C.C. Department of Prostatectomy, Urology, Medical, Surgical and Oncological Sciences

The study - M&M

Primary outcomes

- Operative time
- CGC time
- Mean contrast medium
- Fluoroscopy time
- Dose-area product (DAP)
- CGC fluoroscopy time

Secondary outcomes

- Perioperative mortality and morbidity
- Endleak incidence
- Number of iliac stent-graft
- Survival and freedom from reintervention

Università degli Studi di Palermo | Mr. Prof. C.C. Department of Prostatectomy, Urology, Medical, Surgical and Oncological Sciences

Università degli Studi di Palermo | Mr. Prof. C.C. Department of Prostatectomy, Urology, Medical, Surgical and Oncological Sciences

Conclusions

- The SGC is a simple adjunctive trick aiming to facilitate and ease the CL cannulation
- SGC was feasible with no registered postoperative complications
- SGC was not associated to an increased overall procedure time
- SGC reduced significantly
 - contrast medium usage
 - radiation exposure
 - CGC time
- The crossed limb configuration is indicated when guidewires are crossed at the aortic bifurcation
- In eEVAR, when time is essence, tips to reduce cannulation time should be always employed.
